

Donna Degen, M.S.

Born and raised in San Antonio (and proud of it!)

B.S. Biology UTSA 1981

M.S. UTSA 1984
Concentration in
Microbiology, specialty
Pathogenic/Medical
Microbiology

Background

UTSA Microbiology Lab Coordinator three years while in grad school (the 80's!)

Nine years pre-clinical drug development oncology research (lab bench work). One of the first labs to conduct in vitro testing of current drugs like Taxol and Taxotere (breast ca), Gemcytibine (pancreatic ca), Irinotecan (colorectal ca).

Seventeen years clinical drug development research and patient studies: Phase 1, 2 and 3 protocol oversight, data monitoring and collection. Contributed to the approvals of Avastin (colorectal ca) and Ocrevus (MS) for Genentech.

After lots of tiring travel, back to UTSA! Teaching: Intro to Micro, then the CUREs program and.....

the Microbial Diversity and Antibiotic Discovery course!

Microbial Diversity & Antibiotic Discovery CUREs Overview

CUREs Program 2024-2025
Department of Integrative Biology

Defining the Goals

Defining the Goals

Why?

The Global Antibiotic Crisis

“US Burden of AMR Deaths is Unacceptably High.”
-CDC

Antimicrobial Resistance (AMR) is one of the Leading Causes of Deaths Worldwide.

- **1.27 Million AMR Deaths** worldwide
- **4.95 Million AMR Associated Deaths**
- **2.8 Million AMR infections** in US each year leading to **35,000 Deaths**

RESISTANCE CRISIS

By 2050, antimicrobial resistance could be responsible for 1.91 million deaths per year. Mortality is projected to rise by around 70% among people aged over 70, but will continue to fall in young children and babies.

Microbial Diversity & Antibiotic Discovery

Pace of antibiotic discovery is not keeping up with rate of AMR evolution.

Antibiotic Pipeline Step I: Soil Collection & Microbial Community Characterization

**Soil Collection &
Characterization**

**DNA extraction &
amplification**

**Gene Sequencing &
Analysis at UTSA's
Genomic Core Facility**

**Over 1,000
species
identified
in a single
gram of
soil!**

**Species
Identification**

Antibiotic Pipeline Step II:

Isolation of antimicrobial compounds from soil microbes

**Culture bacteria
from soil sample**

**Pick diverse
colonies of soil
bacteria for
antibiotic screening**

**Create a test layer
of “problem”
bacteria**

**Screen colonies for
ability to inhibit
growth of
“problem” bacteria**

Antibiotic Pipeline Step III:

Analysis of chemical compounds from antibiotic-producing soil microbes

**Chemical
Extraction of
Antibiotic
Compounds**

**Separation of
bioactive
compounds for
further study**

**Chemical, genomic,
and metabolic
testing at UTSA or
sent to
UW-Madison**

**New
Antibiotic!**

Top Species Classification Results

Classification	Number of Reads	% Total Reads
Unclassified at Species level	93,598	75.87%
Megasphaera hominis	5,657	4.59%
Tepidanaerobacter syntrophicus	2,124	1.72%
Candidatus Scalindua brodae	2,083	1.69%
Kribbella ginsengisoli	966	0.78%
Pelotomaculum isophthalicum	724	0.59%
Novosphingobium yangbajingensis	568	0.46%
Anaerolinea thermolimosa	555	0.45%

Total Species-level Taxonomic Categories Identified: 662. This table shows the top 8 of 662 classifications.

Note: The "Other" category in this pie chart is the sum of all classifications with less than 3.50% abundance.
